

## Sash Jammer Fitting Instructions

### Fitting to a window

- 1 Locate the Sash Jammer onto the windows, making sure that the window can still open and close without contact with the Sash Jammer Body.
- 2 Drill 3mm pilot holes into the section using the Sash Jammer as a jig.
- 3 If after drilling through (at least 2 walls) of PVCu the 3mm drill encounters section re-inforcing (steel or aluminium), fixing the Sash Jammer to this re-inforcement will create a solid fix. Either drill through re-inforcing section or use a self tapping screw to penetrate. If no reinforcement, please refer to separate section below.
- 4 To obtain a solid fix use re-inforcing retaining screws. Once fitted, select correct size of Button and position underneath the lever in the hole provided. A slight compression should be achieved but not so that the PVCu section will be marked.

NOTE: If using a 3mm drill use 3.9mm or 4.3mm diameter screws. Length of screw is determined by the position of the re-inforcing, this will vary from section to section.

### Window with no re-inforcing.

- 5 If after drilling through the PVCu, NO re-inforcing is encountered, the following fix is required. Where the 3mm drill holes are located increase the hole sizes to 9mm using a 9mm drill also drilling through any internal webs close to the surface.
- 6 Insert the Jack Nut within the 9mm hole, tap with a hammer if tight or increase hole size. The Jack Nut should be a relatively tight fit.
- 7 Using M5 Machine Thread screws of at least 35mm, place the Sash Jammer over the Jack Nuts and insert the screws through the Sash Jammer and into the Jack Nuts.
- 8 Tighten with a high-torque battery or electric screw driver until the Sash Jammer is fixed solid. The Jack Nuts will act as a rawl type product and fix themselves underneath the PVC-u section creating a solid fixture. Once fitted, select correct size of Button and position underneath the lever in the hole provided. A slight compression should be achieved but not so that the PVC-u section will be marked.

NOTE: Please ensure that the correct screw driver bit is used for the type of screw used. The screw heads will strip otherwise. If this does occur before a solid fix is made, take the existing screw out and use a new one.

# Fab&Fix

## Suitability of Sash Jammers.

- 1 On internally beaded window section. I.e where the glass is fitted from the inside:- The Sash Jammer will fit all sections.
- 2 On externally beaded window section. I.e where the glass is fitted from the outside:- The fitter should check that the Sash Jammer may be located onto the section glazing chamber where the glass is situated.

## Height between Window Sash and Window Frame.

- 3 Check the height between the Sash and Frame to ensure that it will accommodate a Sash Jammer.

Heights achievable with standard pack:-

- \* Minimum height accommodated - 16mm (Using 5mm Button).
- \* Maximum height accommodated - 20mm (Using 1mm Button).

## Open-Out windows.

- 4 Fit Sash Jammer to the **opening part** of the window. (Sash)

## Open-In windows.

- 5 Fit Sash Jammer to the **frame part** of the window. (Frame)

## Where to fit the Sash Jammers (Windows).

**Locking Side:-** The Sash Jammer is a product that increases security on windows already in situ and compliments locking systems already in place.

### Window fitted with Cockspur handles:-

Upto 900mm Sash Rebate - 1 Cockspur handle located centrally = 2 Sash Jammers  
2 Cockspur handles located at each end = 2 Sash Jammers

Over 900mm Sash Rebate - 1Cockspur handle located centrally = 4 Sash Jammers  
(One in the center).

### Window fitted with locking Espag with No Shootbolt:-

Upto 900mm Sash Rebate - 2 Sash Jammers inline with the keeps to support the locking system.  
Over 900mm Sash Rebate - 3 Sash Jammers - the espag will probably have 3 lockpoints, 1 Sash Jammer to support each locking point.

## Where to fit the Sash Jammers (Doors).

### Single Door:

#### Door fitted with Centre Latch, Roller / Mushroom Cams:-

4 Sash Jammers placed evenly along the length of door.

#### Door fitted with Centre Latch, Centre Deadbolt, Roller / Mushrrom Cams:-

2 Sash Jammers placed 150mm from top and bottom.

#### Door fitted with Centre Latch, Centre Deadbolt, Top & Bottom Dead or Hook Bolts:-

No Sash Jammers needed on such a locking system.

### French Doors (Double Openers):-

**Main Door** - As above

**Slave Door** - 4 Sash Jammers placed evenly along the length of door.

**NOTE:-** Sash jammers may be difficult to position on French Doors, but they do need securing as they are often very weak.
